Make the *pendulum* reel with Claude

A badge on a string swings across your headline, and the words change where the string passes. One prompt, no editing skills.

Why it works

It's 12 seconds, it moves from the first frame, and every swing shows one thing you do, then swings back to one call to action. People watch it twice to read every word, which is exactly the signal Instagram looks for.

What you need

- **Claude** (the app or claude.ai) or **Claude Code**
- Your **4 services** (two short lines each), **1 call to action**, your **2 brand colours** and your **@handle**
- Your phone, to screen-record and post

1 Plan your words

Two short lines per word, max about 8 letters per line. Alternate service, call to action, service, call to action.

Example: SCROLL WEBSITES · COMMENT GUIDE · LAUNCH PAGES · COMMENT GUIDE · AI CHATBOTS · COMMENT GUIDE · BOOKING SYSTEMS · COMMENT GUIDE

2 Paste the prompt into Claude

Open **Claude** (app or claude.ai) or **Claude Code**, start a **new chat** and paste the prompt from the next page. Change only the parts in **[brackets]** (initials, colours, words, @handle) and send it.

3 Preview and fine-tune

In Claude you get a live preview (an "artifact") next to the chat; in Claude Code you get an HTML file to open in your browser. Press **Play**. Not quite right? Reply in plain words, one change at a time: *"swing a bit slower"*, *"make the words bigger"*, *"use my blue #1A73E8"*, *"add 2 more swings"*.

4 Turn it into a reel

Claude: open the preview on your phone (Claude app or the artifact's share link), make it full screen, start your phone's **screen recording** and press Play. **Claude Code:** ask it for the MP4 directly (prompt on the next page). Then post it as a reel and add music from Instagram's library.

The prompt (copy all of it)

```
Create a single-file HTML page (an artifact) with a 1080×1920 canvas, scaled to fit the
screen (9:16), on a plain [#F4F1EA] background. Make a 12-second animation that starts when I
press a Play button and can be replayed.

1. Pendulum: a thin dark line hangs from a pivot above the top edge (x = centre, y = -420)
down to a round white badge (radius 92 px, soft shadow) with my initials "[AZ]" in [#0062F5]
in the middle. String length 1450 px.
2. It swings left and right 7 times, one swing per second, between -17° and +17°, with a
cosine ease so it slows at the ends like a real pendulum.
3. Behind it, a big two-line headline in a very heavy bold font, centred at y = 820, 134 px.
Words in this order: [SCROLL / WEBSITES], [COMMENT / GUIDE], [LAUNCH / PAGES], [COMMENT /
GUIDE], [AI / CHATBOTS], [COMMENT / GUIDE], [BOOKING / SYSTEMS], [COMMENT / GUIDE]. The call-
to-action words are in [#0062F5], the others near-black.
4. The wipe: during each swing the string is the edge between two words. Draw the headline
twice and clip each copy to one side of the line through the pivot and the badge: the side
the pendulum is moving away from shows the NEW word, the side ahead shows the OLD word, so
the new word appears exactly where the string has passed.
5. A small "[@yourhandle]" above the headline and a small footer "[WEBSITES • AI • MOTION]"
at y = 1500.
6. After the last swing the pendulum settles to the middle with a small damped wobble, the
string and words fade out, the badge moves to the centre (y = 1000) and grows a little, and "
[@yourhandle]" and "[comment GUIDE for the free guide]" appear under it.

Use time-based animation (requestAnimationFrame) so the timing is the same on every device.
No external libraries, no sound.
```

Logo: the prompt uses your initials in a circle, which always works. To use your real logo, add "use this logo image: [public link to your logo]" at the end.

Handy follow-up prompts

- *"Make the wipe edge follow the string exactly, even at the ends of the swing."*
- *"Add a soft shadow under the words and make the font heavier."*
- *"Make a second version in dark mode: background #0B1220, white words."*
- *"Change the words to: [your list]."*

Claude Code: get the MP4 directly

After the page works, ask Claude Code: *"Render this page frame by frame at 30 fps with Playwright (one screenshot per frame, time set by code, not real time) and join the frames into a 1080×1920 MP4 with ffmpeg. Add a short whoosh at the middle of each swing."* That's how ours was made.
